Goal 4: finite optical-response checks on an analytic flat de Sitter control
Flat geometry can have a nonzero flux residual
CBL residual
Redshift z
Observed $C[d_r]$, $\tau = 0.2z$
Constant calibration $d_r = 1.1d$
Opacity-corrected geometry
Report a set before assigning a geometric cause
Compatible geometric C
Redshift z
Declared opacity-derivative outer set
Naive residual
True geometric residual
First-derivative alternative; avoid the vertex
κ in $(H_0/c)^2$
Redshift z
Uncorrected curvature estimator
Corrected (zero)
