
CF4 source-conditioned sensitivity: 2048 coupled four-window draws
A Actual-data summary and selection perturbation
Original deterministic fit
North-weighted deterministic fit
Joint working-law median + 5–95% range
$A_j = \|s_j\|/H_j$
Gaussian redshift-window center
B Selection sensitivity of one joint event
Assumed normalized density bound Γ = 2
Coupled finite-law mass
Physical x, Q, F, G remain unknown mass = 1
Mass of $\max_j A_j > t$
Strict threshold t
C Floor can erase apparent depth contrast
Comparison / reference z
0.040 / 0.025
0.060 / 0.025
0.080 / 0.025
Median floored apparent depth ratio
Effective floor $B\delta$ in A units
D Anchor changes the reported threshold event
z = 0.025
z = 0.040
z = 0.060
z = 0.080
Mass of $A_j/B > 1$
Declared dimensionless anchor B
Actual CF4 sufficient statistics + assumed Gaussian working covariance. No physical posterior, certified F, or anomaly p-value.
